

# CASE STUDY: Delgado Ezequiel - 9 years old

November 2015

Todos Juntos

First Treatment: 27/04/2015

Last Treatment: 30/10/2015

8 appointments

Delgado is 9 years old and lives in Slum Independencia with his mother who works as a 'cartonero' (a person who collects cardboard all night for recycling). His facial asymmetry is due to the fact that whilst his mother was pregnant she worked in a recycling plant. She would stand for 8 hours a day and would continually rest her belly on the transport belt resulting in her son's deformed face.

Delgado came to the Clinic and was diagnosed with 8 cavities, one of which had to be treated as a root canal. He also had 5 milk teeth extracted as they were too infected to treat. He was suffering from a lot of pain and his gums were infected and inflamed (see the second photo). He now uses a toothbrush regularly and will return for further treatments when all his permanent teeth have grown.
